

The relationship between breast size, physical activity levels and media influence on perception.

Emmy Schulz

THE BIG PROBLEM

How does the perception of breast size affect the levels of physical activity among females, and what factors mediate this relationship?

- Constantly changing body image “trends”
- Overall societal pressure creating stigma

- Personal body/breast size dissatisfaction
- Changes in physical activity habits

1) Women with larger breasts are less likely to participate in high-intensity physical activities compared to women with smaller breast sizes.

2) Women with larger breast sizes are more likely to experience limitations/pain during physical activity compared to women with smaller breast sizes.

3) Higher consumption of media portraying a specific “ideal” body type is associated with greater dissatisfaction with breast size among women.

METHODS & FRAMEWORK

- Using a quantitative approach: online survey, consisting of mainly likert scale questions, and free response questions.
- Gathers perceptions, attitudes/ behaviors & collects measurable data.
- Correlations, means and regressions.
- In total I had 24, complete responses.

AA/A= # 1	(7 total respondents)
B= # 2	(10 total respondents)
C= # 3	(2 total respondents)
D= # 4	(2 total respondents)
DD/E & DDD/E= # 5	(3 total respondents)

1. Collect data through survey.
2. Use excel to categorize survey questions.
3. Convert reported breast sizes into 5 groups to be useful in results.
4. Run the tests on data.

RESULTS

(1) Women with larger breasts are less likely to participate in high-intensity physical activities compared to women with smaller breast sizes.

- **High intensity**
P-value= .86 and r-value of .036
- **Low Intensity**
p-value=.27 and r value of .23

Questions used:

- How strongly do you agree/disagree with this statement? I prefer high-intensity physical activity (High/ rapid heart rate (130+), high perspiration, extreme fatigue or soreness)
- How strongly do you agree/disagree with this statement? I prefer lower-intensity physical activity (Low heart rate (under 120), minimal perspiration, and minimal fatigue or soreness)

(2) Women with larger breast sizes are more likely to experience limitations/pain during physical activity compared to women with smaller breast sizes.

Questions used:

- Reported breast sizes and the likert scale question, “How strongly do you disagree/agree with this statement: Physical activity can be painful due to my breast size.”

ANOVA					
	<i>df</i>	<i>SS</i>	<i>MS</i>	<i>F</i>	<i>Significance F</i>
Regression	1	17.7086341	17.7086341	16.4907898	0.00051992
Residual	22	23.6246993	1.07384997		
Total	23	41.3333333			

(3) Higher consumption of media portraying a specific “ideal” body type is associated with greater dissatisfaction with breast size among women.

Media per day mean: 2.9 (= roughly 1-2 hours per day)

Level of influence over breast size perception mean: 1.9 (=moderate/heavy influence.)

A	B	C
	<i>Media time per day</i>	<i>Media influence on percept</i>
	1	
perception of breast size	0.393786	

These two questions used had answers ranking these values 1-4:

(Media time)

1=less than 30 mins.

2= 30-60 mins

3=1-2 hours

4=2+ hours

(Influence amount on breast size perception)

1=heavy influence

2=moderate influence

3=slight influence

4=no influence

LIMITATIONS/ IMPLICATIONS

- Small sample size (24 participants)
- Convenience sampling/self-reported data.
- Future research should aim to utilize different forms of sampling with a larger and more diverse participant pool
- Majority of participants had A or B-sized breasts, we were limited on the amount of C, D, DD/E, and DDD/E-sized breasts.

These findings have important implications, especially within strategic communication:

- Media portrayals of diverse body types including realistic representations of women with varying breast sizes can help shift societal norms and reduce body image dissatisfaction.
- Campaigns should focus on promoting body positivity and empowering women to engage in physical activity regardless of perceived societal judgment.

The background is a light pink color. It features several decorative elements: a large rounded rectangle with a slightly darker pink border, a smaller rounded rectangle in the top right corner, and several sets of concentric, wavy lines in shades of pink and magenta. The text "THANK YOU" is centered in a black, serif font.

THANK YOU
